

I'm pleased to report it has returned – or has it simply been overlooked?

My son, Luke, caught one flying in our garden in morning sunshine on 20th March 1994. I did not recognise it at the time. It did look a bit like *Eriocrania sparrmannella* Bosc. (to me anyway) and its flight was not unlike that species. I mentioned this to my friend Dave Appleton, who almost at once took one on his way to work at Segensworth, three miles from its ancient haunts, on 10th March this year. Inspired by this, I took my morning cuppa to the bottom of the garden and found it flying (as originally reported) in sunshine from shortly after 7.30am for about an hour and a half, but only in near calm conditions. I found no cases, nor was there any obvious place to look. It wouldn't be an easy species to find if you were not local. I wonder if there is any significance in its re-discovery near a railway station?— RICHARD DICKSON, 39 Serpentine Road, Fareham, Hampshire PO16 7ED.

Agrilus sinuatus (Ol.) (Col.: Buprestidae) at Tunbridge Wells, Kent

On 25th August 1994 I found a single specimen of this attractive metallic purple beetle on the edge of Folly Shaw, a small piece of undisturbed woodland in Hilbert Recreation Ground, Tunbridge Wells. It was sitting conspicuously on nettle foliage, having presumably been washed down from nearby hawthorns by a recent shower. This species would appear to be a relatively new arrival in this area, since there are no examples in the comprehensive collection of local Coleoptera assembled by R.A. Crowson between 1938 and 1947 and held at Tunbridge Wells Museum.

Die Schmetterlinge Baden-Württembergs. Edited by Günter Ebert. **Band (volume) 3**, Nachtfalter (moths) I. 518pp., 344 colour photographs, 166 diagrams and drawings, 64 distribution maps, hardback, size 17x24cm. Price DM 79. **Band 4**, Nachtfalter II. 535pp., 488 colour photographs, 204 diagrams and drawings, 122 distribution maps, hardback, size 17x24cm. Price DM 79. Verlag Eugen Ulmer, 1994.

Following on the publication in 1991 of the sumptuous first two volumes covering the butterflies (*Tagfalter*) of the south-western German state of Baden-Württemberg, work on this opulent and monumental series has continued with the moths (*Nachtfalter*). In December 1994, the first two volumes, embracing the Hepialidae, Cossidae, Zygaenidae, Limacodidae, Psychidae, Thryididae, Bombycidae, Endromidae, Lasciocampidae, Lemoniidae, Saturnidae, Sphingidae, Notodontidae, Dilobidae, Thaumetopoeidae, Drepanidae, Thyatiridae, Lymantriidae, Nolidae and Ctenuchidae, were published and launched at a reception given by the publisher in the State Natural History Museum in Karlsruhe, Germany, attended by Günter Ebert and his co-authors, and the State Minister for Nature Conservation. It is the financial support it has received from the latter's ministry and the state museum which has kept the price of these
